MM50

Dataset File: [MM50.csv](#)

Description: "Van Peteghem, V. and Vanhoucke, M., 2014, "An experimental investigation of metaheuristics for the multi-mode resource-constrained project scheduling problem on new dataset instances", European Journal of Operational Research, 235(1), 6272 (doi:10.1016/j.ejor.2013.10.012)."

Number of instances: 540

Format: mm

Statistics

Set statistics:

Number of instances: 540

- Solved (exact proc.): 450 (83.33%)

- Closed (LB=UB): 458 (84.81%)

- Open (LB<UB): 82 (15.19%)

Average deviation over CPM:

- Lower bound: 20.61%

- Upper bound: 22.28%

Sum of lower bounds: 19145

Sum of upper bounds: 19435

Open time units: 290 (1.51%)

Avg CPU lower bounds: 447.221s (m)

Avg CPU upper bounds: 473.785s (m)

Avg CPU optimal sol.: 595.679s (m)

Reference 2:

- Lower bounds: 197 (36.48%)

Reference 1:

- Upper bounds: 505 (93.52%)

Reference 4:

- Lower bounds: 7 (1.30%)

- Upper bounds: 25 (4.63%)

- Optimal solutions: 450 (83.33%)

Reporting new results

2/3

- Advantages:
 - Results can be applied on a dataset by order of publication data
 - A new results file with just the best known solutions of all results files, is automatically created
 - If a researcher want, can download not just the dataset, but also results of other authors
 - All the data updated in the site, can easy replicate by another researcher, after download all dataset and result files
- Checks done on result files:
 - Upper bounds – the solutions are validated against all restrictions.
 - Lower bounds – if a lower bound is incompatible with an upper bound, then the results file of the lower bound became invalid, and should be removed from the dataset
 - Optimal solutions – this result can be obtained by an exact procedure, and is reported as both, an upper bound and lower bound, and follows the same checks
- Website: [solutionsupdate.ugent.be](#) part of [projectmanagement.ugent.be/research/data](#)
- Results confirmation: [http://solutionsupdate.ugent.be/index.php/results-file/josecoelho/j30mmsh](#)

5

5

Reporting new results 3/3

- Software client tool allow:
 - all web operations to be done locally;
 - to better see the dataset file;
 - check the solutions to exclude bugs from being reported in the literature
 - calculate average deviation for each run;
 - create subsets (training set) on existing datasets (just the open instances, or other subset);
 - change names and/or format of instance files;
 - to generate files to export new data to PSPLIB and MMLIB.

Solutions Update

About Dataset Results

dataset C:\Users\jcoel\OneDrive\B\Investigatio\mp\MRCPSPUpdate\MM50\MM50.csv loaded.

Update of tables of BKS on RCPSP and MMRCPS 1/4

- Volume of work in the deterministic RCPSP and MMRCPS
 - Papers and tags are in <https://www.zotero.org/groups/2504748/mrcpsp/library>

7

7

Update of tables of BKS on RCPSP and MMRCPS 2/4

- What can avoid a place with all UB/LB?
 - Can average performance values in a published paper become out of range of valid values?
 - Invalid performance on J60 set (BKS is 10.37% for UB and 9.67% for LB):
 - Ali et al 2016, performance of 0,98 and get worst with more schedules, both below LB
 - Rostami et al 2014, performance of 9.94 - it is possible, but new BKS would need to be reported
 - Montoya-Torres et al 2010, performance of 5, below LB
 - Tchomte et al 2007, performance of 9.01, below LB
 - Invalid performance on J120 set (BKS is 29.01% for UB and 24.98% for LB):
 - Mulin 2018, performance of 50K of 30.25, it became the best procedure reported, but not in Pellerin 2020 paper
 - Ali et al 2016, performance on 5K schedules of 19.6, below LB
 - Kadan and Kadan 2014, performance of 25.32 - it is possible, but new BKS would need to be reported
 - Rostami et al 2014, performance of 21.73, below LB
 - Invalid performance on J30 mm set (BKS is 12.28% for UB and 10.48% for LB)
 - Soliman et al 2014, performance of 11.30 - it is possible, but new BKS would need to be reported
 - Are wrong instance results appear in international journals?
 - Liess and Michelon 2007, reported invalid LB referenced in Horbach 2010
 - Is it hard to know what instances are closed or open?
 - Araujo et al. 2020 - Table 1 - invalid number of open instances in PSPLIB and MMLIB
 - Chakraborty et. al. 2020 - Table 5 - invalid number of closed instances in MMLIB

Table 4: Lower Bound for Average Deviation from the Optimal Solution for J60

Algorithm	Reference	Number of problems solved	Average deviation (%)
Optimal (GA)	This paper	10/10	0.00
PSO	Montoya et al. (2010)	9/10	10.37

Table 5: Lower Bound for Average Deviation from the Optimal Solution for J120

Algorithm	Reference	Number of problems solved	Average deviation (%)
Optimal (GA)	This paper	10/10	0.00
PSO	Montoya et al. (2010)	9/10	29.01

Table 1: Benchmark datasets

Library	Instances	Group	Size (tasks)
PSPLIB	MMRCPS1000	100	10
PSPLIB	MMRCPS2000	200	20
PSPLIB	MMRCPS3000	300	30
PSPLIB	MMRCPS4000	400	40
PSPLIB	MMRCPS5000	500	50
PSPLIB	MMRCPS6000	600	60
PSPLIB	MMRCPS7000	700	70
PSPLIB	MMRCPS8000	800	80
PSPLIB	MMRCPS9000	900	90
PSPLIB	MMRCPS10000	1000	100

Table 5: Basic properties of the MMLIB datasets (Giles, 2011; Van Pelt and Van Pelt, 2014)

Dataset	Number of instances	Number of tasks	Number of machines	Number of renewable resources	Number of non-renewable resources	Execution mode per activity
MMLIB100	100	100	100	100	100	100
MMLIB200	200	200	200	200	200	200

PSO	Montoya et al. (2010)	9/10	10.37
PSO	Montoya et al. (2010)	9/10	10.37
PSO	Montoya et al. (2010)	9/10	10.37

Table III: AVERAGE RESPONSE VARIABLE AND OPTIMUM RATE FOR J120

Algorithm	Reference	Year	Average deviation (%)	Optimum rate (%)
Proposed method	This study	2023	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25

Table II: AVERAGE DEVIATION FROM OPTIMUM SOLUTION

Algorithm	Reference	Year	Average deviation (%)	Optimum rate (%)
Proposed method	This study	2023	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25
PSO	Ali et al. (2016)	2016	34.59	30.25

Table 3: The Avg. dev, optimal rate and feasible rate for the proposed algorithm at different stopping conditions.

Stopping condition	Average deviation (%)	Optimal rate (%)	Feasible rate (%)
1000	34.59	30.25	30.25
10000	34.59	30.25	30.25
20000	34.59	30.25	30.25
30000	34.59	30.25	30.25
40000	34.59	30.25	30.25
50000	34.59	30.25	30.25

found that the results reported by Liess and Michelon (2008) contain some inconsistencies. The lower bounds indicated for instances j0026-8, j0030-5 and j0030-7 conflict with the upper bounds 82, 83 and 84 listed for them in PSPLIB. These upper bounds are also confirmed

8

An example of an experiment with NetRes

	SP	AD	LA	TF	OS	RC	RS
0-0,1	54%	-	4.9%	0.4%	59%	0%	7.4%
0,1-0,3	13%	1.5%	0.3%	0.5%	31%	9.1%	7.2%
0,3-0,5	0.2%	4.5%	0.1%	2.8%	1.3%	4.9%	1.3%
0,5-0,7	0%	13%	0.1%	8%	0.4%	3.8%	0.5%
0,7-0,9	0%	4.9%	0%	17%	0%	1.8%	0.1%
0,9-1	-	1.9%	-	24%	0%	1.4%	0%

- NetRes:
 - High diversity in terms of project indicators;
 - Large number of instances, to allow select subsets needed (3,8 million instances).
- Percentage of hard instances in NetRes depending on each project indicator
 - Hard = not solved by DH92 procedure in 1 second
 - Phase transitions found in all indicators in the table
- The table could not be constructed based in other sets reported in Vanhoucke et. al. (2016) since not enough instances exist for all indicators and values.
- The client tool can be used to select the subset of instances needed and is easy to reference any subset.
- Suggestions:
 - Training set: use instances in steps of 10.000
 - Exact procedures: use instances in steps of 1.000
 - Meta-heuristics: use instances in steps of 100
 - Priority rules / fast lower bounds: use the full dataset

11

11

Diversity of dataset CV 1/2

- CV set:
 - 623 small instances that are open, with 20 to 30 activities and 1 to 4 renewable resources;
 - Build based on existing instances, with a procedure that removes or changes the instance, to allow the instance became smaller and harder;
 - Diversity is taken in account, with a run to get hard instances in zones with few instances generated.
- The instances are not all too parallel, we can see that only LA and RS indicators have most instances concentrated on 0-0,2 range;
- The instances in CV set are open after 20 hours runs, using a diverse set of procedures. Total run time (generating and testing), corresponds to 45 years on a single processor

#Activities	#Resources	CNC	OS	SP	AD
20-21 #4	1 #1	0-1 #405	0-0,1 #85	0-0,1 #232	0-0,2 #8

0,8-1 #3	0,8-1 #189	0,6-0,8 #13	0,9-1 #203		

12

Diversity of dataset CV 2/2

- Uses of CV set:
 - Can incentivate new radically different procedures. We hope the small size and diversity of the set may help;
 - An in-depth analysis of the instances may reveal what makes these instances are very hard, when with a small change became easy to solve;
 - Since the instances are hard, and have small size, this set is ideal to test heavy lower bounds;
- The results on the time spend to obtain the best UB/LB appear to indicate that is harder to get the best LB, than the best UB, so updates on results are expected from lower bounds and exact procedures

13

Conclusion

- Proposed:
 - SolutionsUpdate to keep results on RCPSP and MMRCPS updated at all times
 - A new large dataset, NetRes, with diversity in many project indicators and large number of instances available, to fit several research needs
 - A new CV set of small, hard and open instances, mainly to be used in lower bounds and exact procedures
- Website: solutionsupdate.ugent.be part of projectmanagement.ugent.be/research/data
